

- 1 Introduction
- 2 Setup
- 3 **Create a Generic pass class**
- 4 Open the project in Android Studio
- 5 Create the Add to Google Wallet button
- 6 Check if the Google Wallet API is available
- 7 Create a Generic pass object
- 8 Add the pass to Google Wallet
- 9 Handle the savePassesJwt result
- 10 Congratulations

3. Create a Generic pass class

In this step, you will create the base class for your pass. Any time a new pass is created for a user, it will inherit the properties defined in the pass class.

The pass class you will create during this codelab uses the flexibility of Generic passes to create an object that works as both an identity badge and challenge points tracker. When a pass object is created from this class, it will look like the following graphic.
