1. Introduction

Overview

The Google Wallet API allows you to engage with users through various types of passes: loyalty cards, offers, gift cards, event tickets, transit tickets, boarding passes, and more. Each pass type, or pass class, comes with use-case specific fields and features to enhance the user experience.

However, these might not fit every use case. To create a more customized experience, you can use the generic pass type. Here are some example use cases for the generic pass type:

- Parking passes
- Library membership cards
